

This past Saturday the entire sneaker world was taken by surprise as the [Cheap KD 10 Wave Runner 700](#) had it's out of nowhere silent pre-order launch. The latest YEEZY offering cost \$300 and sold-out on YEEZY Supply's website rather quickly. Of course, like any other YEEZY this shoe is already being resold for crazy amounts of money even though it doesn't ship until November. The YEEZY authority, yeezymafia posted some images that break down what the Wave Runner's shoe is made out of, well at least what the sole of the shoe is made out of. At first glance, it's not clear where adidas hid the Boost technology in this shoe, but this breakdown shows off how it's done. A rather thin rubber outsole treads the bottom of the shoe while a foam mid-sole provides the landing space for the Boost insert that rests right where the foot would lay. This 3-layer cushioning may provide the YEEZY Wave Runner 700 with the most comfortable design yet.

These particular images have provided us with a new sense of execution and craftsmanship that was taken with this particular release. [Cheap KD 10 For Sale](#) The kicks feature a white textile canvas mesh base complete with matching crisp white leather paneling, a patented leather 'Midnight Navy' mudguard in its original cut, complimented by 'University Blue' embroidered Jumpman logos located at the lateral ankle collar of the sneaker while a white midsole and translucent outsole exposes the midfoot carbon fiber shank closes out the kicks.

Every year [KD 10 For Sale](#) incessantly reveals at least one premium Air Foamposite colorway that can either go left and miss with sneaker fans, or right and sell out quickly. This year's "Vachetta Tan" Nike Air Foamposite Pro carried potential, but was slept on possibly because of it's steep price point. Despite the unique colorway's unsuccessful run, Nike is geared up for next year's calendar of releases, one of which we believe will be one of Nike's PRM colorways.
